

Pre-AGI AI Action Governance

Governing Autonomous Authority, Scale, and Consequential Action Before AGI

**Develop intelligence. Govern authority.
Enable beneficial AI. Bound consequential action.**

This DOI develops a practical framework for governing high-impact AI before AGI. Rather than treating intelligence itself as the primary regulatory target, it focuses on the point where machine capability becomes consequential external action: autonomous authority, permissions, access, scale, looping, verification, interruptibility, and accountability.

Core Idea

Intelligence does not imply authority. A capable AI model is not automatically a high-impact autonomous system. Risk depends on the deployed configuration - model, agent runtime, tools, permissions, scale, persistence, target environment, and control structure. Governance should therefore become stronger as the system's maximum credible autonomous impact increases.

Framework

Pre-AGI AI Action Governance	govern consequential machine action without waiting for an AGI threshold.
Scale-Looping Power	recognize that bounded intelligence can become operationally powerful through repeated search, evaluation, memory, tools, and massive parallelism.
Autonomous Impact Threshold (AIT)	identify when an ordinary AI tool becomes a consequential autonomous system requiring stronger controls.
AI Action Accountability Stack	preserve attributable responsibility across owners, deployers, platforms, permissions, agents, tools, and consequences.
Governance Target Selection	distinguish model evaluation from the actual governance trigger: autonomous action capability and consequence.

Canonical Governance Rule

Model evaluation informs governance.
Action capability triggers governance.
Consequence determines governance intensity.

Research Scope

The repository contains five core research papers, one strategic discussion note on competitive AI governance, and a Grand Map. It is intended for AI engineers, safety researchers, platform designers, policymakers, regulators, and readers interested in practical governance of agentic AI.

Repository and DOI

DOI: See the DOI badge and archived release linked from the GitHub repository.

Pre-AGI governance asks a practical question: How do we make abundant machine intelligence structurally controllable before it acquires abundant machine authority?
